Patent claims

A method for digital data transmission with a variable bandwidth in a network which has at least one server (3), a user terminal (6) and a network management system (4),

having the following steps:

- establishment of a connection between the user terminal (6) and the server (3) at least partly by means of an ADSL connection (12),
- transmission (8) of bandwidth selection data from the user terminal (6) to the network management system (4) assigned to the server (3), and
- to the user terminal (6) via the ADSL connection (12) and/or in the opposite direction with a bandwidth corresponding to the previously transmitted bandwidth selection data, in which case the network management system (4) communicates billing data to a billing device (5), assigned to the server (3), in a manner dependent on the previously transmitted bandwidth selection data.
- 2. The method as claimed in claim 1, characterized
- 25 in that the bandwidth selection data are transmitted via the EOC channel (8) of the ADSL connection (12).
 - The method as claimed in one of the preceding claims, characterized
- in that prior to the transmission (8) of the bandwidth selection data to the user terminal (6), a plurality of predetermined bandwidths which can be selected by the user are transmitted and displayed on a display device (14) of the user terminal (6).

AMENDED SHEET

35 4. The method as claimed in claim 3,

characterized

in that the maximum bandwidth of the predetermined bandwidths that can be selected is set in a manner dependent on the system capabilities.

The method as claimed in one of the preceding claims,

characterized

in that once the bandwidth selection data have been received, the network management system (4) transmits setting data to the ATU-C (2) of the ADSL system, which forwards the setting data to the ATU-R (1) of the ADSL system via the EOC channel (8) of the ADSL system for the purpose of synchronizing the settings.
